

Easily and efficiently review communications with patent-pending innovation.

- Normalizes texts and chats from multiple sources and formats, including Skype, WhatsApp®, SMS/MMS and more
- Threads individual messages or by modality to display relationship-based communication patterns
- Displays data in the same native conversation context as seen on the mobile device
- Identify and interrogate gaps in communication patterns

Mobile Device eDiscovery

Mobile devices now dominate the share of total minutes spent online.

Nearly **23B** chat & text messages are sent everyday.

Mobile data is one of the fastest growing sources of discoverable ESI. Yet, eDiscovery still depends on manual workflows - reviewing data collected from mobile devices outside of standard review platforms. Mobile data (SMS, IM, third-party chats, linked photos, videos, voicemails, etc.) is typically extracted in one bulk, comma-delimited report or Excel file. Communications become rows and columns on a spreadsheet, creating an inefficient, time consuming and disconnected review process.

Advanced Message Review A Patent-Pending, Defensible Approach to Mobile Data

Designed to automate and integrate the review of mobile data, Advanced Message Review converts mobile device images into a format that can be easily understood, searched, analyzed and reviewed. Chat conversations are threaded together and displayed as they would be on your mobile device. Photos, videos, and voicemails are linked in-line with time stamps so you can better understand conversation flow. And because Advanced Message Review is compatible with all major review platforms, including Relativity®, analytics tools, like concept clustering and search, can be used to reduce and prioritize documents for review.

Conversation threads are viewable in the same look and feel of native apps on the mobile devices.

In-line images, videos and voicemails can be seen and reviewed within the conversation threads.

Deleted messages that are recovered can be easily identified.
